♦ A dense layer is a deeply connected neural network layer. It is the most common and frequently used layer.

```
# Adding a fully connected layer
classifier.add(Dense(units=128, activation='relu'))
classifier.add(Dense(units=5, activation='softmax')) # softmax for more than 2
```

- ♦ The neurons in the last Dense layer, use Softmax activation to convert their outputs into respective probabilities.
- ♦ Keras provides a simple method, a summary to get the full information about the model and its layers.
